---

Today I have been building the keyboard for the wearable. So far it's almost ready, except for the Atmega8 chip which has not yet been programmed, and I still need to create a case for it. The chorder is a

[Spiffchorder](#)

, or a Spaceman Spiff's chording keyboard. It's a free hardware project and it's so simple to build that even I (newbie with electronics) seem to be able to. Even though I didn't make that board itself, nor did I have to hunt for those parts, I just soldered and wired it. It's possible to build it even without a board they say.

I have been playing around with some possible cases. One cool and pretty comfortable was a cheap mouse that came with a Dell computer. Other mice I have tried to hold and dry-train typing with were not too comfortable. [This](#) is another one that I like, seems like it's a bit harder to make and I have never worked with leather. Then I could be the guy who kids point at and say "That's the guy who's wearing a mouse on his belt!"

Little do they know that's actually my keyboard.
